

LISTING OF THE CLAIMS

Please amend the claims as shown below. An identifier indicating the status of each claim is provided.

1. (Currently Amended) A process for remote communication between a command transmitter (2) and a command receiver (4) operating a garage door (10) or gate actuator (9), via a command repeater (3) furnished with means for receiving signals (21), with means for sending signals (22), with a processing unit (23) and with a memory (24) comprising an identifier of the command repeater (3), which process comprises the following steps:

generation and transmission of a signal comprising an identifier of the transmitter (2) and a control command, from the transmitter (2) to the command repeater (3),

reception of this signal by the command repeater (3),

recognition of the identifier contained in the signal,

modification of the identifier by the command repeater (3) to include a code dependent on a repeater identifying code,

transmission of a modified signal comprising a modified identifier and the command, from the command repeater (3) to the command receiver (4),

reception of the modified signal by the command receiver (4),

recognition of the modified identifier contained in this signal.

2. (Original) The process as claimed in claim 1, wherein the step of "modification of the identifier by the command repeater" comprises the substitution of the identifier of the transmitter (2) by the identifier of the command repeater (3).

3. (Original) The process as claimed in claim 1, wherein the step of "modification of the identifier by the command repeater" comprises the substitution of the identifier of the transmitter (2) by a combination of the identifier of the transmitter (2) and of the identifier of the command repeater (3).

4. (Currently Amended) A process for configuring a control device (1) comprising

a command transmitter (2) furnished with means for sending signals (6),
a command repeater (3) furnished with means for receiving signals (21), with
means for sending signals (22), with a processing unit (23) and with a memory (24) and
a command receiver operating a garage door (10) or gate actuator (9), allowing
remote communication between the command transmitter (2) and the command receiver (4) via
the command repeater (2),

wherein the learning of identification codes comprises a communication between
the command transmitter (2) and the command repeater (3), on the one hand, and a
communication between the command repeater (3) and the command receiver (4), on the other
hand, ~~the identification codes of the command transmitter and of the command repeater being~~
~~different~~

wherein identification generated by the command transmitter and sent to the
repeater is different from identification generated by the repeater and sent to the command
receiver, in that the latter includes a code dependent on a repeater identifying code.

5. (Previously Presented) A command repeater (3) comprising means for
receiving signals (21), means for sending signals (22), a processing unit (23) and a memory (24)
furnished with an algorithm embodying the method of claim 1.

6. (Original) The command repeater (3) as claimed in claim 5, which repeater is
devoid of any user interface.

7. (Original) The command repeater (3) as claimed in claim 5, which repeater is
placed in a vehicle (7) and powered by the battery via the ignition switch (5) of the vehicle.

8. (Original) The command repeater (3) as claimed in claim 5, which repeater is
provided with a user interface allowing input of a code.

9. (Original) A control device (1) comprising a command repeater (3) as claimed
in claim 5, a command transmitter (2) and a command receiver (4) operating a garage door (10)
or gate actuator (9).

10. (Currently Amended) A system for activating an object actuating system coupled to a movable object, comprising:

at least one user command transmitter manipulable by a person to generate at least one signal representing at least one of: an identification, and a command; and

at least one repeater receiving signals from the command transmitter, the repeater sending a command signal to the object actuating system upon receipt of a valid identification from the command transmitter,

wherein the object actuating system moves the movable object only if a valid identification is received from the repeater, and

wherein the identification generated by the command transmitter and sent to the repeater is different from the identification generated by the repeater and sent to the object actuating system, in that the latter includes a code dependent on a repeater identifying code.
